

IN THE ABSTRACT

Please amend the abstract as follows:

A sliding screen frame for a closure assembly having an opening and an existing track for mounting a screen, said ~~the~~ screen frame ~~comprising~~ **has** framing sections **with both inner and outer side edges**, ~~having an outer side edge and an inner side edge~~, and a screen housing from which a screen is payed out and accumulated, ~~said~~ **The** framing sections **are being** adapted ~~proximate~~ **on** the outer side edge to interfit with the existing track of the closure assembly to enable the sliding screen frame to slide across the opening of the closure assembly and the frame sections also being adapted ~~proximate~~ **on** the inner side edge thereof to support and guide the free end of the screen between a fully payed out and a fully accumulated position, ~~further comprising~~ **The screen frame has** a mitreless corner connector ~~having a generally "L" shaped member including two perpendicular legs extending from a central box shaped part, said connector~~ for connecting adjacent framing sections without the need for mitre cuts thereof ~~and said box shaped part for butting with the adjacent framing sections when joined to said connector to establish continuity with the adjacent edges of said sections~~ **between the corner connector and the adjacent framing sections.**
